Use of indigenous knowledge and culture in preserving health: A study on tribals in Mayurbhanj district of Odisha

Yashodhara Mohanta and Dr. Chandrashree Lenka

Abstract
The objectives of the present study was to discuss about the use of traditional knowledge and culture in preserving public health nutrition of tribal people of Mayurbhanj district of Odisha. One hundred households were selected by random purposive sampling method for collection of data and information on traditional food and health practices was collected by interview cum questionnaire method. The results of the study revealed that they used different types of locally available foods for their health benefits. Handia was their common beverage and they used it for their better health and getting relief from tiredness. For getting relief from diseased conditions they used various types of things such as Wild ant chutney for cough, Gangasiuli leaves juice for Malaria fever, Amarpoi leaves for Diarrhea, Amarpoi leaves and oil for scabies, Handia rasi, Pedipedica leaves and Mehendi roots for Jaundice, Bug with banana for Piles, etc. Palta medicines for son and Babul leaves for fair baby during pregnancy, Kalibahu and Gaichira (one type of root) for recovery after delivery, Bottle gourd and sago dana kheer for better lactation, Even though medical facilities are available in that area still then the people were not utilizing it because of their misconception and lack of knowledge. Therefore Government should give emphasis on nutrition and health education of the tribal people and further indepth scientific research should be carried out in this direction to adopt new strategies for future generation.

Keywords: Food habits, babul leaves, pedipedica leaves, traditional knowledge

Introduction
Tribals preserve, enrich and enliven the cultural diversity of India besides making up a substantial portion of total population of the country. Odisha has a large number of tribal communities who love to live in nature and maintained their livelihood with their own indigenous / traditional knowledge system specially the disadvantaged ones who are deprived of economical, social and political benefits. Further, abundance of tribal people's access to forest product and indigenous health care system contributes positively to the tribal health. They have their own system of diagnosis and cure. They prepare their own medicine usually using herbs and other items collected from the nature and processed locally. These natural resources and skills are disappearing. Moreover, traditional system cannot treat most of the present new emerging diseases that modern medicine can do. Health and sanitation are often worse in regions where tribal peoples live. The country is placed in a piquant position having succeeded in solving some problems while new ones are emerging. Current development in various dimension has not been able to offer succor of the poor especially the tribal population. Indeed the difference between the tribal people and other population groups is widening. With modernization of the present society, the needs of those disadvantaged populations were brought to the limelight and their knowledge system was given the importance and treated as real knowledge for survival. This paper is intended to unfurl the use of traditional knowledge and culture in improving the public health nutrition of the tribal people of Mayurbhanj district of Odisha.

Objectives
The objective of the study were
1. To study the socio-economic conditions of the respondents.
2. To study the types of treatment adopted to improve health condition.
3. To study the use of indigenous foods in treating some diseases.
4. To analyze practice of indigenous knowledge for reproductive health.
5. To study different myths in treating some health problems.

Materials and Methodology: The study was carried out in Mayurbhanj districts of Odisha. One hundred households were selected for the study by random purposive sampling method. The data was collected by questionnaire cum interview method with the help of pretested and modified questions. The head of the family was interviewed for the collection of data. Information on indigenous knowledge for treating different health problems was collected by interviewing the participants. The collected data was tabulated and analyzed with the help of statistical tools and techniques and are discussed below.

Results and Discussion

a) Socio-Economic indicator of the respondents
The socio-economic conditions of the respondents provides relevant information regarding their family background. It was observed that majority of the respondents belong to the age group 25 to 60 yrs i.e. all of them were Hindu by religion and were scheduled tribe. 95% of them were literate. Nuclear family system was found to be prevalent in that area. All of them like to be in joint family but they preferred to be in nuclear family system to avail government facilities such as ration card, BPL Card, Indira Abas Yojana etc. Primary occupation of the respondents was found to be agriculture (83%) and all (100%) of them belonged to low income group.

Most of them were staying in their kutcha houses and kept poultry, goat, sheep, cow, pig in their houses for the purpose of meat.

b) Types of treatment adopted to improve health condition
It was observed that 100% of the respondents believe in magic treatment and herbal treatment but only 46% of them practice magic treatment, specially for fever, diarrhea, cholera, colic pain etc. They also believe in medical treatment and went to nearby to hospital with ANM, Asha Karmi or Anganwadi worker for their health problem. But in case of severity of the disease, they went to both local gunia as well as consult doctor and follow their treatment.

Common household remedies practiced by the respondents were Wild ant (kurkuti) chutney or pickles, one table spoon or Basanga leaves juice with three drops honey branded with hot iron (morning empty stomach) for cough, warm Torani with Drumstick leaves (once or twice a day), and warm Masoor Dal with Drumstick leaves (once or twice a day) for cold. Pigeon meat cooked by ghee or Bat meat for Asthma, five Amarpoi leaves juice with five black peper (morning empty stomach), soak water of Puffed rice (morning empty stomach) and five Guava leaves juice with five black pepper (morning empty stomach) for Diarrhea. Burn skin and ear of goat for Dysentery, chewing 3-5 black peper in indigestion. They also use three bed Bug with banana (morning in empty stomach) and warm fresh milk (morning in empty stomach) for getting recovery from piles. Three Gangasiuli leaves juices with three black pepper/ginger/honey and branded by hot iron (morning 3, 7, and 21 days) were commonly used for malaria and also used for joint pain. Handia Rasi 2-3 times three in a day, Pedi pedica leaves, Raw rice water with mehendi paste for 15 days was used for getting relief from Jaundice. Scrubbing green chilly and Pig oil on tougue and drinking Peja (warm discarded water of rice) and fresh sheep milk were commonly practiced to get rid of glossitis, cheilosis and angular stomatitis. They also used Kunduru leaves juice, merry gold leaves juice (it also used in minor cut /bleeding) for ear infection, Lentil paste for boil, neem oil for scabies, black berry seeds powder for diabetes, Juice and boil water of Drumstick leaves for high blood pressure.

Handia was their common beverage and they commonly took it to get relief from tiredness and weakness.

d) Composition and use of indigenous medicine related to reproductive health

The information on food or remedies adopted by the people of studied area was found to be interesting. 88% of respondents used palta medicine for son where as 10% of the respondents took small gadish fish inside a ripe banana for getting son during pregnancy on full moon day before sun rise after taking bath. Palta medicine is prepared by the local Kabiraj with combination of dung of black female goat having only male calf (8-10 in number), roots of three black brinjal tree and blackgram. They may take it in one dose or in three doses on any day after taking bath in the early morning and praying Gram Devi in one and half month of pregnancy. Non vegetarian food and water rice is restricted for 31 days for Palta medicine. For fair child they took powder of babul leaves from third month of pregnancy up to nine month. They took one spoon of it in the morning in empty stomach with water for first fifteen days of third month to 9th month. 99% of the respondents found to take suitika goli prepared with Kalibahu and gaichira roots for getting quick recovery after delivery. For better milk secretion, they took sago dana kheer & bottle gourd sabjee and branded with hot iron rod on head(Nia chenka) 40 for getting quick recovery after delivery. Scrubbing green chilly and Pig oil on tougue and drinking Peja (warm discarded water of rice) and fresh sheep milk were commonly practiced to get rid of glossitis, cheilosis and angular stomatitis. They also used Kunduru leaves juice, merry gold leaves juice (it also used in minor cut /bleeding) for ear infection, Lentil paste for boil, neem oil for scabies, black berry seeds powder for diabetes, Juice and boil water of Drumstick leaves for high blood pressure.

Conclusion: Despite remarkable worldwide progress in the field of diagnostics, curative and preventive health, still the tribal people of Odisha are living with their own traditional knowledge system, customs, beliefs and myth intact. Thus herculean efforts should be taken in all direction to address the health and nutritional problems of the tribal people by educating them on food safety and security, creating awareness on nutritive value of different food stuffs and about available...
health care services at their door step. Emphasis should be
given on preserving indigenous knowledge of tribals related
to their health benefits & further scientific research should be
carried out in this direction to adopt new strategies for future
generation.
